

## **RoboLPR** – Fast, Accurate, Easy to Use

**RoboLPR** captures and reports data on unauthorized vehicles that travel through your designated security zone — even when those vehicles are moving. Gathering input from video or still images, RoboLPR stores vehicle information in a database for quick and easy reference. It's a must-have for businesses that need to monitor deliveries, calculate accurate parking fees, control employee access or secure such areas as airports or border crossings.

RoboLPR records detection times, license plate numbers, license plate images and “entire car” images. The system can be set to alert authorized personnel when a “problem” vehicle has violated a security zone, and vehicle data can also be linked to individual owners.

For law enforcement agencies, RoboLPR is a powerful tool that gives officers access to instant data on any vehicle that crosses the field of vision. Using artificial intelligence and state-of-the-art sensor technology, RoboLPR scans and captures license plate information, then automatically compares that data to owner records — including arrest warrants, insurance and registration status or suspected criminal activity. When a violation is detected, officers in the field receive an instant alert on the vehicle — and the system displays all known information on the owner.

### **Features**

- Available for existing MDCs or fully integrated to the Robo III
- Powerful adaptive optical character recognition (AOCR)
- “Hot-List” matching of stolen cars, drug traffic–related vehicles, homicide vehicles, uninsured drivers, outstanding felony warrants
- Audio/Video “In-Car” alarm notification
- A true force multiplier for automated crime fighting & crime prevention
